# Chapter 1

## Spin Networks

Mostly follows “A Spin Network Primer” [?]

### 1.1 Diagrammatic Mathematics

Diagrammatic algebra designed too handle the combinatorics of irreducible representations, all the familiar results of representation theory have diagrammatical form.

#### 1.1.1 Line, Bend ad Loop

Consider the tensor

$$(\delta_B^A) = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}$$

which can be represented diagrammatically as in fig 1.1

$$\delta_A^B \sim \begin{array}{c} \text{B} \\ \left( \right. \\ \text{A} \end{array}$$

Figure 1.1: Diagrammatically representation of  $\delta_B^A$

Consider the two antisymmetric tensors

$$(\epsilon_{AB}) = (\epsilon^{AB}) = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix}. \quad (1.1)$$

We associate a curve with a matrix with two upper (lower) indices. The first trial for  $\epsilon_{AB}$  we look at is in fig (1.2) and for  $\epsilon^{AB}$  fig (1.3)

$$\mathfrak{E}_{AB} \sim \begin{array}{c} \text{---} \text{---} \text{---} \\ \text{A} \quad \text{B} \end{array}$$

Figure 1.2: A trial diagrammatic representation of  $\epsilon_{AB}$ .

$$\mathfrak{E}^{AB} \sim \begin{array}{c} \text{A} \quad \text{B} \\ \text{---} \text{---} \end{array}$$

Figure 1.3: A trial diagrammatic representation of  $\epsilon_{AB}$ .

This fits well with the diagramatitics of  $\delta_A^C \epsilon_{CB} = \epsilon_{AB}$ . We soon find trouble with this choose however. Firstly:

$$\delta_A^C \epsilon_{CD} \epsilon^{DE} \delta_E^B = -\delta_A^B$$

and straightening a line yields a minus sign:

$$\begin{array}{c} B \\ \text{---} \text{---} \text{---} \\ A \end{array} = - \begin{array}{c} B \\ \text{---} \\ A \end{array}$$

Figure 1.4: First problem with diagrammatic representation of  $\epsilon_{AB}$  and  $\epsilon^{AB}$ .

Secondaly, as a consequence of

$$\epsilon_{AD} \epsilon_{BC} \epsilon^{CD} = -\epsilon_{AB},$$

However, these “topological” difficulties can be fixed by modifying the definition

$$\epsilon_{AB} \rightarrow \tilde{\epsilon}_{AB} = i\epsilon_{AB}.$$

Figure 1.5: Second problem with diagrammatic representation of  $\epsilon_{AB}$  and  $\epsilon^{AB}$ .

The diagrams in fig (1.4) and fig (1.5) will henceforth be associated with  $\tilde{\epsilon}_{AB}$  and  $\tilde{\epsilon}^{AB}$  respectively.

As the indices take two values, we have the identity

$$\epsilon_{[EB}\epsilon_{C]F} = 0 \quad (1.2)$$

which reduces to

$$\epsilon_{EB}\epsilon_{CF} + \epsilon_{BC}\epsilon_{EF} + \epsilon_{CE}\epsilon_{BF} = 0 \quad (1.3)$$

Contracting this with  $\epsilon^{EA}$  and  $\epsilon^{FD}$ , then using  $\epsilon_{EB}\epsilon^{EA} = \delta_B^A$ ,  $\epsilon_{CF}\epsilon^{FD} = -\delta_C^D$  and  $\epsilon_{EF}\epsilon^{EA}\epsilon^{FD} = \epsilon^{AD}$  etc we obtain the so-called binor identity:

$$\epsilon_{AC}\epsilon^{BD} = \delta_A^B\delta_C^D - \delta_A^D\delta_C^B \quad (1.4)$$

Using the definitions of the  $\tilde{\epsilon}$  matrices, the binor identity becomes

$$\tilde{\epsilon}_{AC}\tilde{\epsilon}^{BD} - \delta_A^D\delta_C^B + \delta_A^B\delta_C^D = 0. \quad (1.5)$$

Then introducing the rule that we assign a minus sign to each crossing, equation (1.5) can be diagrammatically, represented as in fig 1.6.

Figure 1.6: The diagrammatic representation of the binor identity  $\tilde{\epsilon}_{AC}\tilde{\epsilon}^{BD} - \delta_A^D\delta_C^B + \delta_A^B\delta_C^D = 0$

For more than

$$\delta_A^C \epsilon_{CD} = \epsilon_{AB}.$$

$$\delta_A^C \epsilon_{CD} \epsilon^{DE} \delta_E^B = \epsilon_{AD} \epsilon^{DB} = -\delta_A^B, \quad (1.6)$$

$$\epsilon_{AD} \epsilon_{BC} \epsilon^{CD} = -\epsilon_{AB} \quad (1.7)$$

$$\epsilon_{AB} \rightarrow \tilde{\epsilon}_{AB} = i\epsilon_{AB} \quad (1.8)$$

$$\delta_A^D \quad (1.9)$$

Using these rules, we can show that these strands behave as would thin strings in the plane; one can arbitrary deform a graphical expression without changing its meaning.

In translating a diagram into tensor notation, we use

1. assign a minus sign to each
2. assign a minus sign to each crossing

### 1.1.2 Symmetrizing Products of Delta Functions

Define the  $D_{(A B)}^{A' B'}$  as the symmetric product of two delta functions:

$$D_{(A B)}^{A' B'} := \frac{1}{2!} \left( \delta_A^{A'} \delta_B^{B'} + \delta_B^{A'} \delta_A^{B'} \right) \quad (1.10)$$

$D_{(A B)}^{A' B'}$  are projectors i.e.

$$D_{(C D)}^{A' B'} D_{(A B)}^{C D} = \frac{1}{2!} \left( \delta_C^{A'} \delta_D^{B'} + \delta_D^{A'} \delta_C^{B'} \right) D_{(A B)}^{C D} = D_{(A B)}^{(A' B')} = D_{(A B)}^{A' B'} \quad (1.11)$$

More generally  $D_{(A B \dots D)}^{A' B' \dots D'}$ , the symmetric product of  $n$  delta functions, is a projector:

$$\begin{aligned} D_{(E F \dots H)}^{A' B' \dots D'} D_{(A B \dots D)}^{E F \dots H} &= \frac{1}{n!} \left( \delta_E^{A'} \delta_F^{B'} \dots \delta_H^{D'} + \dots \right) D_{(A B \dots D)}^{E F \dots H} \\ &= D_{(A B \dots D)}^{(E F \dots H)} = D_{(A B \dots D)}^{E F \dots H}. \end{aligned} \quad (1.12)$$

This general result can be represented diagrammatically as in fig 1.1.2.

Figure 1.7: The symmetric product of  $n$  delta functions, is a projector.

Also note we have the result that if  $D_{(A B \dots D_1 \dots D_k)}^{A' B' \dots D'_1 \dots D'_k}$ , the symmetric product of  $n$  delta functions, and if  $D_{(D_1 \dots D_k)}^{D'_1 \dots D'_k}$ , the symmetric product of  $k$  delta functions ( $k < n$ ):

$$\begin{aligned}
 D_{(A B \dots H_1 \dots H_k)}^{A' B' \dots D'_1 \dots D'_k} D_{(D_1 \dots D_k)}^{H_1 \dots H_k} &= D_{(A B \dots H_1 \dots H_k)}^{A' B' \dots D'_1 \dots D'_k} \frac{1}{k!} \left( \delta_{D_1}^{H_1} \dots \delta_{D_k}^{H_k} + \dots \right) \\
 &= D_{(A B \dots H_1 \dots H_k)}^{A' B' \dots (D'_1 \dots D'_k)} = D_{(A B \dots H_1 \dots H_k)}^{A' B' \dots D'_1 \dots D'_k}.
 \end{aligned} \tag{1.13}$$

This result can be represented diagrammatically as in fig (1.1.2).

Figure 1.8: Applying the symmetric product of  $k$  delta functions to the symmetric product of  $n$  delta functions results in the symmetric product of  $n$  delta functions.

### 1.1.3 Jones-Wenzl Projectors

Starting from the binor identity

$$-\tilde{\epsilon}^{A' B'} \tilde{\epsilon}_{AB} = \delta_A^{A'} \delta_B^{B'} - \delta_B^{A'} \delta_A^{B'}, \tag{1.14}$$

a simple rearrangement gives

$$\frac{1}{2}(\delta_A^{A'} \delta_B^{B'} + \delta_A^{B'} \delta_B^{A'}) = \delta_A^{A'} \delta_B^{B'} + \frac{1}{2} \tilde{\epsilon}_{AB} \tilde{\epsilon}^{A' B'} \tag{1.15}$$

Written in the standard form (see in a moment)

$$\delta_{(A}^{A'} \delta_{B)}^{B'} = \delta_A^{A'} \delta_B^{B'} - \mu_1 \tilde{\epsilon}_{AB} \tilde{\epsilon}^{A'B'} \quad (1.16)$$

where  $\mu_1 = -1/2$ . Which is diagrammatically represented in fig 1.1.3.

Figure 1.9: Diagrammatical representation of equation (1.16) with  $\mu_1 = -1/2$ .

### Jones-Wenzl Projectors for $n = 3$

We can rearrange the symmetric product of the three deltas as follows

$$\begin{aligned} 3\delta_A^{A'} \delta_B^{B'} \delta_C^{C'} &= \delta_A^{A'} \delta_B^{(B'} \delta_C^{C')} + \delta_B^{A'} \delta_A^{(B'} \delta_C^{C')} + \delta_C^{A'} \delta_{(B}^{B'} \delta_A^{C')} \\ &= 3\delta_A^{A'} \delta_B^{(B'} \delta_C^{C')} - \left( \delta_A^{A'} \delta_B^{(B'} \delta_C^{C')} - \delta_B^{A'} \delta_A^{(B'} \delta_C^{C')} \right) - \left( \delta_A^{A'} \delta_B^{(B'} \delta_C^{C')} - \delta_C^{A'} \delta_B^{(B'} \delta_A^{C')} \right) \end{aligned} \quad (1.17)$$

This rearrangement, (1.17), can be represented diagrammatically as in fig (1.1.3)

Figure 1.10: graphmath7. Diagrammatical representation of (1.17).

Multiply (1.14) by  $\delta_C^{C'}$  and symmetrize over the upper indices  $B'$  and  $C'$  to get

$$\delta_A^{A'} \delta_B^{(B'} \delta_C^{C')} - \delta_B^{A'} \delta_A^{(B'} \delta_C^{C')} = -\tilde{\epsilon}_{AB} \tilde{\epsilon}^{A'(B'} \delta_C^{C')}, \quad (1.18)$$

Figure 1.11: Diagrammatical representation of (1.18)

which is expressed diagrammatically as fig.(1.1.3)

Using this in fig.(1.1.3) we obtain the equation displayed in fig (1.1.3)

Figure 1.12: graphmath8.

$$\delta_A^{(A')} \delta_B^{(B')} \delta_C^{(C')} = \delta_A^{A'} \delta_B^{(B')} \delta_C^{(C')} + \frac{1}{3} \tilde{\epsilon}_{AB} \tilde{\epsilon}^{A'(B')} \delta_C^{(C')} + \frac{1}{3} \tilde{\epsilon}_{AC} \tilde{\epsilon}^{A'(C')} \delta_B^{(B')} \quad (1.19)$$

we obtain

$$\delta_A^{(A')} \delta_B^{(B')} \delta_C^{(C')} = \delta_A^{A'} \delta_B^{(B')} \delta_C^{(C')} + \frac{2}{3} \tilde{\epsilon}_{A(B} \delta_C^{(C')} \tilde{\epsilon}^{(C')B')A'} \quad (1.20)$$

Or

$$\delta_A^{(A')} \delta_B^{(B')} \delta_C^{(C')} = \delta_A^{A'} \delta_B^{(B')} \delta_C^{(C')} - \mu_1 \tilde{\epsilon}_{A(B} \delta_C^{(C')} \tilde{\epsilon}^{(C')B')A'} \quad (1.21)$$

where

$$\mu_1 = -2/3. \quad (1.22)$$

This is represented in fig (1.1.3)

Figure 1.13: Diagram for 3. Compact diagrammatic representation of (1.21)

### Jones-Wenzl Projectors for Arbitrary $n$

We now consider the symmetric product of  $n$   $\delta$ 's. We have:

$$\begin{aligned}
 n\delta_A^{(A')} \delta_B^{(B')} \delta_C^{(C')} \dots \delta_F^{(F')} &= \delta_A^{(A')} \delta_B^{(B')} \delta_C^{(C')} \dots \delta_F^{(F')} + \delta_B^{(A')} \delta_A^{(B')} \delta_C^{(C')} \dots \delta_F^{(F')} + \dots + \delta_F^{(A')} \delta_B^{(B')} \delta_C^{(C')} \dots \delta_A^{(F')} \\
 &= n\delta_A^{(A')} \delta_B^{(B')} \delta_C^{(C')} \dots \delta_F^{(F')} - \left( \delta_A^{(A')} \delta_B^{(B')} \delta_C^{(C')} \dots \delta_F^{(F')} - \delta_B^{(A')} \delta_A^{(B')} \delta_C^{(C')} \dots \delta_F^{(F')} \right) - \dots \\
 &\quad \dots - \left( \delta_A^{(A')} \delta_B^{(B')} \delta_C^{(C')} \dots \delta_F^{(F')} - \delta_F^{(A')} \delta_B^{(B')} \delta_C^{(C')} \dots \delta_A^{(F')} \right)
 \end{aligned} \tag{1.23}$$

This is represented by diagram (graphmath11)

$$\begin{aligned}
 n \begin{array}{c} A' B' C' F' \\ | \quad | \quad | \quad | \\ \boxed{\phantom{0000}} \\ | \quad | \quad | \quad | \\ A \quad B \quad C \quad F \end{array} &= \begin{array}{c} A' B' C' F' \\ | \quad | \quad | \quad | \\ \boxed{\phantom{0000}} \\ | \quad | \quad | \quad | \\ A \quad B \quad C \quad F \end{array} + \begin{array}{c} A' B' C' F' \\ | \quad | \quad | \quad | \\ \boxed{\phantom{0000}} \\ | \quad | \quad | \quad | \\ B \quad A \quad C \quad F \end{array} + \dots + \begin{array}{c} A' B' C' F' \\ | \quad | \quad | \quad | \\ \boxed{\phantom{0000}} \\ | \quad | \quad | \quad | \\ F \quad B \quad C \quad A \end{array} = \\
 &= n \begin{array}{c} A' B' C' F' \\ | \quad | \quad | \quad | \\ \boxed{\phantom{0000}} \\ | \quad | \quad | \quad | \\ A \quad B \quad C \quad F \end{array} - \left[ \begin{array}{c} A' B' C' F' \\ | \quad | \quad | \quad | \\ \boxed{\phantom{0000}} \\ | \quad | \quad | \quad | \\ A \quad B \quad C \quad F \end{array} - \begin{array}{c} A' B' C' F' \\ | \quad | \quad | \quad | \\ \boxed{\phantom{0000}} \\ | \quad | \quad | \quad | \\ B \quad A \quad C \quad F \end{array} \right] - \dots - \left[ \begin{array}{c} A' B' C' F' \\ | \quad | \quad | \quad | \\ \boxed{\phantom{0000}} \\ | \quad | \quad | \quad | \\ A \quad B \quad C \quad F \end{array} - \begin{array}{c} A' B' C' F' \\ | \quad | \quad | \quad | \\ \boxed{\phantom{0000}} \\ | \quad | \quad | \quad | \\ F \quad B \quad C \quad A \end{array} \right]
 \end{aligned}$$

Figure 1.14: graphmath11. Representing equation (1.23).

Multiply (1.14) by  $\delta_C^{C'} \dots \delta_F^{F'}$  and symmetrize over the upper indicies  $B', C', \dots, F'$  to get

$$\delta_A^{(A')} \delta_B^{(B')} \delta_C^{(C')} \dots \delta_F^{(F')} - \delta_B^{(A')} \delta_A^{(B')} \delta_C^{(C')} \dots \delta_F^{(F')} = -\tilde{\epsilon}_{AB} \tilde{\epsilon}^{A'(B'} \delta_C^{C'} \dots \delta_F^{F')} \tag{1.24}$$

This is represented by diagram graphmath12

Figure 1.15: graphmath12. Diagrammatical representation of (1.24)

Substituting (1.24) into (1.23) we obtain

$$\delta_A^{(A')} \delta_B^{(B')} \delta_C^{(C')} \dots \delta_F^{(F')} = \delta_A^{A'} \delta_B^{(B')} \delta_C^{(C')} \dots \delta_F^{(F')} + \frac{1}{n} \tilde{\epsilon}_{AB} \tilde{\epsilon}^{A'(B')} \delta_C^{(C')} \dots \delta_F^{(F')} + \dots + \frac{1}{n} \tilde{\epsilon}_{AF} \tilde{\epsilon}^{A'(F')} \delta_C^{(C')} \dots \delta_B^{(B')} \quad (1.25)$$

We obviously have

$$\underbrace{\tilde{\epsilon}_{AB} \tilde{\epsilon}^{A'(B')} \delta_C^{(C')} \dots \delta_F^{(F')} + \tilde{\epsilon}_{AC} \tilde{\epsilon}^{A'(C')} \delta_B^{(B')} \dots \delta_F^{(F')} \dots + \tilde{\epsilon}_{AF} \tilde{\epsilon}^{A'(F')} \delta_C^{(C')} \dots \delta_B^{(B')}}_{n-1 \text{ terms}} = +(n-1) \tilde{\epsilon}_{A(B)} \delta_C^{(C')} \dots \delta_F^{(F')} \tilde{\epsilon}^{(F')A'}. \quad (1.26)$$

we obtain

$$\delta_{(A}^{A'} \delta_B^{(B')} \delta_C^{(C')} \dots \delta_F^{(F')} = \delta_A^{A'} \delta_{(B}^{(B')} \delta_C^{(C')} \dots \delta_F^{(F')} + (n-1) \epsilon_{A(B)} \delta_C^{(C')} \dots \delta_F^{(F')} \epsilon^{(F')A'} \quad (1.27)$$

This is represented in fig (1.1.3)

In compact form we have fig (1.1.3):

### 1.1.4 Contractions of Symmetrised Lines

We perform a contraction the symmetrised lines as given by fig (1.1.4), and we denote the resulting value  $\Delta_n$ . For example  $\Delta_1 = -2$ :

$$\Delta_1 = \delta_A^{A'} (\tilde{\epsilon}_{A'C} \delta_D^C \tilde{\epsilon}^{DA}) = -\delta_A^{A'} \delta_{A'}^A = -2.$$

As an example, we explicitly work out the value of  $\Delta_2$  using the graphical method as shown in fig (graphmath2A). We find that the result is  $\Delta_2 = 3$ .

$$\begin{aligned}
& \begin{array}{c} A' \ B' \ C' \ F' \\ | \quad | \quad | \quad | \\ \boxed{\phantom{0000}} \\ | \quad | \quad | \quad | \\ A \ B \ C \ F \end{array} = n \begin{array}{c} A' \ B' \ C' \ F' \\ | \quad | \quad | \quad | \\ \boxed{\phantom{0000}} \\ | \quad | \quad | \quad | \\ A \ B \ C \ F \end{array} - \begin{array}{c} A' \ B' \ C' \ F' \\ | \quad | \quad | \quad | \\ \boxed{\phantom{0000}} \\ | \quad | \quad | \quad | \\ A \ B \ C \ F \end{array} - \dots - \begin{array}{c} A' \ B' \ C' \ F' \\ | \quad | \quad | \quad | \\ \boxed{\phantom{0000}} \\ | \quad | \quad | \quad | \\ A \ F \ C \ B \end{array} \\
& = n \begin{array}{c} A' \ B' \ C' \ F' \\ | \quad | \quad | \quad | \\ \boxed{\phantom{0000}} \\ | \quad | \quad | \quad | \\ A \ B \ C \ F \end{array} - (n-1) \begin{array}{c} A' \ B' \ C' \ F' \\ | \quad | \quad | \quad | \\ \boxed{\phantom{0000}} \\ | \quad | \quad | \quad | \\ A \ B \ C \ F \end{array}
\end{aligned}$$

Figure 1.16: graphmath13.

$$\begin{array}{c} n+1 \\ | \\ \boxed{\phantom{0000}} \\ | \end{array} = \begin{array}{c} n \\ | \\ \boxed{\phantom{0000}} \\ | \end{array} - \mu_n \begin{array}{c} \phantom{n+1} \\ | \phantom{n+1} \\ \boxed{\phantom{0000}} \\ | \phantom{n+1} \\ \phantom{n+1} \end{array}$$

Figure 1.17: .

In order to find the value of  $\Delta_n$  for  $n > 2$  we derive recursive relations.

$$\Delta_{n+1} = -(2 + \mu_n)\Delta_n$$

Rearranged

$$\mu_n = -\frac{\Delta_{n+1}}{\Delta_n} - 2$$

We know from fig (1.1.3) that  $\mu_n = \frac{n-1}{n}$ , therefore

$$\begin{aligned}
\Delta_n &= -2\Delta_{n-1} + \frac{n-1}{n}\Delta_{n-1} \\
&= \Delta_{n-1}\left[\frac{n-1}{n} - 2\right] \\
&= -\Delta_{n-1}\left[\frac{n+1}{n}\right]
\end{aligned} \tag{1.28}$$

Employing this recursive relation we obtain,

Figure 1.18: graphmath2. The contraction of the symmetric product of deltas, the resulting values denoted  $\Delta_n$ .

$$\begin{array}{c} 2 \\ \text{---} \end{array} \bigcirc = \frac{1}{2} \left[ \begin{array}{c} \bullet \quad \bullet \\ \text{---} \quad \text{---} \\ \bullet \quad \bullet \end{array} \quad \begin{array}{c} \bullet \quad \bullet \\ \text{---} \quad \text{---} \\ \bullet \quad \bullet \end{array} \right] - \begin{array}{c} \bullet \quad \bullet \\ \text{---} \quad \text{---} \\ \bullet \quad \bullet \end{array} = \frac{1}{2} \left[ \bigcirc \bigcirc - \bigcirc \right] = 3$$

Figure 1.19: graphmath2A. Calculation of  $\Delta_2$ .

$$\begin{aligned}
 \Delta_n &= -\Delta_{n-1} \left[ \frac{n+1}{n} \right] \\
 &= (-1)^2 \Delta_{n-2} \left[ \frac{n}{n-1} \right] \left[ \frac{n+1}{n} \right] \\
 &= (-1)^2 \Delta_{n-2} \left[ \frac{n+1}{n-1} \right] \\
 &= (-1)^3 \Delta_{n-3} \left[ \frac{n+1}{n-2} \right] \\
 &\quad \vdots \\
 &= (-1)^{n-1} \frac{(n+1)}{2} \Delta_1 \\
 &= (-1)^n (n+1)
 \end{aligned} \tag{1.29}$$

where we have used  $\Delta_1 = -2$ .

So that

$$\Delta_n = (-1)^n (n+1). \tag{1.30}$$

We derive a recursive relation between  $\Delta_{n+2}$ ,  $\Delta_{n+1}$  and  $\Delta_n$ .

The one contraction of an  $(n+1)$ -symmetrised product is proportional to an  $n$ -symmetrised product, as shown in fig graphmath3

$$\begin{aligned}
& \text{Diagram 1} = \text{Diagram 2} - \mu_n \text{Diagram 3} \\
& = \text{Diagram 4} - \mu_n \text{Diagram 5} = -(2 + \mu_n) \text{Diagram 6}
\end{aligned}$$

Figure 1.20: graphmath3A .

$$\text{Diagram 1} = x \text{Diagram 2}$$

Figure 1.21: graphmath3 .

By definition of  $\Delta_n$ , we see that  $x$  is given by  $\Delta_{n+1}/\Delta_n$ . (see fig graphmath1)

Now, if

$$\text{Box}(n) \text{ with loop} = \frac{\Delta_{n+1}}{\Delta_n} \text{Box}(n)$$

Figure 1.22: graphmath1.

$$\text{Box}(n, 1, 1) = \text{Box}(n, 1) + y \cdot \text{Diagram with two boxes and two 1 inputs}$$

Figure 1.23: P math4.

it follows that

$$\text{Box}(n, 1, 1) = 0 = \text{Box}(n, 1) + y \cdot \text{Diagram with two boxes and two 1 inputs}$$

Figure 1.24: graphmath5.

Hence

$$\begin{aligned}
0 &= \text{Diagram 1} + y \frac{\Delta_{n+1}}{\Delta_n} \text{Diagram 2} \\
&= \text{Diagram 3} + y \frac{\Delta_{n+1}}{\Delta_n} \text{Diagram 4}
\end{aligned}$$

Figure 1.25: graphmath6.

Therefore  $y = \Delta_n / \Delta_{n+1}$  and the recursion takes the form

$$\text{Diagram 5} = \text{Diagram 6} - \left( \frac{\Delta_n}{\Delta_{n+1}} \right) \text{Diagram 7}$$

Figure 1.26: P math4.

It follows that

$$\Delta_{n+2} = -2\Delta_{n+1} - \Delta_n \tag{1.31}$$

with  $\Delta_1 = -2$  and  $\Delta_2 = 3$ . This obviously has a unique solution which is

$$\Delta_n = (-1)^n (n + 1), \tag{1.32}$$

as is easily checked:

$$\begin{aligned}
-2\Delta_{n+1} - \Delta_n &= -2(-1)^{n+1}(n+2) - (-1)^n(n+1) \\
&= (-1)^{n+2}[2(n+2) - (n+1)] \\
&= (-1)^{n+2}(n+3) \\
&= \Delta_{n+2},
\end{aligned} \tag{1.33}$$

with

$$\Delta_1 = (-1)^1(1+1)$$

$$\Delta_2 = (-1)^2(2+1).$$

in agreement with calculations we have already performed.

Alternatively, first note that we have the recursion relation between  $\Delta_n$  and  $\Delta_{n+1}$

$$\begin{aligned}
\Delta_{n+1} + \Delta_n &= (-1)(\Delta_n + \Delta_{n-1}) \\
&= (-1)^2(\Delta_{n-1} + \Delta_{n-2}) \\
&\quad \dots \\
&= (-1)^{n-1}(\Delta_2 + \Delta_1) \\
&= (-1)^{n-1}(3-2) = (-1)^{n-1}
\end{aligned} \tag{1.34}$$

From which we obtain

$$\begin{aligned}
\Delta_n &= -\Delta_{n-1} + (-1)^n \\
&= \Delta_{n-2} + 2(-1)^n \\
&= -\Delta_{n-3} + 3(-1)^n \\
&\quad \dots \\
&= (-1)^{n-1}(\Delta_1 + (n-1)(-1)^n) \\
&= (-1)^n(n+1).
\end{aligned} \tag{1.35}$$

each containing a turn back.

Figure 1.27: Definition of 3-vertex.

### 1.1.5 3-Vertices

We define a 3-vertex as in fig...

The “internal” labels  $i, j, k$  are positive integers determined by the external labels  $a, b, c$  via

$$\begin{aligned} i &= \frac{a + b - c}{2} \\ j &= \frac{a + c - b}{2} \\ k &= \frac{b + c - a}{2}. \end{aligned} \tag{1.36}$$

We consider the “bubble” diagram.

**Lemma 1.1.1** *The network is zero if  $a \neq b$ . If  $a = b$ , then*

Figure 1.28: P.

**Proof:**

Assume that  $a > b$ .

where

Figure 1.29: graphmath15.

$$\begin{aligned}
 i &= \frac{a+c-d}{2} & l &= \frac{c+d-b}{2} \\
 j &= \frac{a+d-c}{2} & m &= \frac{c+b-d}{2} \\
 k &= \frac{c+d-a}{2} & n &= \frac{b+d-c}{2}.
 \end{aligned} \tag{1.37}$$

Rewritting, we find  $e = (a - b)/2$

Figure 1.30: graphmath16.

Consider expanding each of the two middle projectors into their sum of products of  $\delta$ 's. It follows that each term will contain a turn-back with respect to the  $a$ -projector above and give zero.

Now assume that  $a = b$ . Consider

Hence

and

Figure 1.31: graphmath17.

Figure 1.32: graphmath18.

Consider expanding each of the two middle projectors into their sum of products of  $\delta$ 's. Only straight-ahead terms survive the extra projector at the bottom. Thus

Hence

Figure 1.33: graphmath18A.

Figure 1.34: graphmath19.

□

$$N_{abc} \begin{pmatrix} a & b & c \\ m_a & m_b & m_c \end{pmatrix} \quad (1.38)$$

$$N_{abc} = \left[ \frac{(a+b-c)!(b+c-a)!(c+a-b)!}{2^2(a+b+c+2)!} \right]^{1/2} \quad (1.39)$$

where

$$\begin{aligned} m &= \frac{a+b-c}{2}, \\ n &= \frac{b+c-a}{2}, \\ p &= \frac{a+c-b}{2}. \end{aligned} \quad (1.40)$$

□

**Definition** Definition  $Net(m, n, p)$  is defined as the diagram on the far right of fig (1.1.2)

Figure 1.35: graphmath20.

Figure 1.36: graphmath21.

□

We will now be working to evaluate  $Net(m, n, p)$ .

In the case  $p = 0$ , we get

$$Net(m, n, 0) \tag{1.41}$$

$$\begin{aligned}
 Net(m, n, 0) &= \text{diagram with two circles labeled } m \text{ and } n \text{ connected by a line} \\
 &= \text{diagram with two circles labeled } m \text{ and } n \text{ each having a line passing through it} \\
 &= \text{diagram with two circles labeled } m \text{ and } n \text{ each having a line passing through it, simplified} \\
 &= \text{diagram with a single circle labeled } m+n \text{ having a line passing through it} = \Delta_{m+n}
 \end{aligned}$$

Figure 1.37: graphmath22.

$Net(n-1, 1, 1)$  we will need to get the eigenvalue of the area operator.  $Net(m, n, 1)$  is easy to deal with.

$$Net(m, n, 1) = -(2 + \mu_m + \mu_n) \Delta_{m+n}. \tag{1.42}$$

Figure 1.38: This one.

Applying this to  $Net(m, n, 1)$  as shown below.

We see that the last term is equivalent to (1.1.5) and so is zero.

The first network is  $-2Net(m, n, 0)$ , where  $Net(m, n, 0)$  has already been calculated in the previous Lemma as  $\Delta_{m+n}$ . The second and third nets are each equivalent to  $Net(m, n, 0)$ . The forth network vanishes. Thus

$$Net(m, n, 1) = -(2\Delta_{m+n} + \mu_m\Delta_{m+n} + \mu_n\Delta_{m+n}).$$

**Definition** Let  $Net(m, n, p_e, p_i)$ , for  $p_e + p_i = p - 1 \geq 1$

**Lemma 1.1.3** *Similarly,*

$$\begin{aligned} Net(m, n, p) &= (-2 - \mu_{m+p-1} - \mu_{n+p-1})Net(m, n, p-1) \\ &\quad + \mu_{m+p-1}\mu_{n+p-1}Net(m, n, 1, p-2) \end{aligned} \quad (1.43)$$

□

**Proof:**

The last network is equivalent to  $Net(m, n, 1, p-2)$  as demonstrated in fig (1.1.5)

**Lemma 1.1.4** *We have*

- (a)  $Net(m, n, p-1, 0) = (-2 - \mu_m - \mu_n)Net(m, n, p-1)$
- (b)  $Net(m, n, p_e, p_i) = (-2 - \mu_{m+p_i} - \mu_{n+p_i})Net(m, n, p-1) + \mu_{m+p_i}\mu_{n+p_i}Net(m, n, p_e + 1, p_i - 1)$

$$\begin{aligned}
\text{Net}(m,n,1) &= \text{Diagram 1} \\
&= \text{Diagram 2} - \mu_n \text{Diagram 3} \\
&= \text{Diagram 4} - \mu_n \text{Diagram 5} \\
&= -\mu_m \text{Diagram 6} + \mu_n \mu_m \text{Diagram 7}
\end{aligned}$$

Figure 1.39: graphmath23.

**Proof:**

The last network is equivalent to  $\text{Net}(m, n, p_e +, p_i - 1)$  as demonstrated in fig (1.1.5).

□

**Recursion relation for Net**

- (a)  $\text{Net}(m, n, p - 1, 0) = (-2 - \mu_m - \mu_n) \text{Net}(m, n, p - 1)$
- (b)  $\text{Net}(m, n, p_e, p_i) = (-2 - \mu_{m+p_i} - \mu_{n+p_i}) \text{Net}(m, n, p - 1) + \mu_{m+p_i} \mu_{n+p_i} \text{Net}(m, n, p_e + 1, p_i - 1)$

Starting with (1.43) and using (b) over again  $p - 2$  times, and then finally using (a) we can obtain a relation:

Figure 1.40: graphmath25.

Figure 1.41: graphmath24.

$$Net(m, n, p) = \rho(m, n, p) Net(m, n, p-1). \quad (1.44)$$

To simplify the analysis, we introduce the following. Since  $\mu_{m+j} = \Delta_{m-1+j}/\Delta_{m+j}$ ,

$$-2 - \mu_{m+j} - \mu_{n+j} = \frac{-2\Delta_{m+j}\Delta_{n+j} - \Delta_{m-1+j}\Delta_{n+j} - \Delta_{m+j}\Delta_{n-1+j}}{\Delta_{m+j}\Delta_{n+j}}$$

Write

$$\alpha_j = -2\Delta_{m+j}\Delta_{n+j} - \Delta_{m-1+j}\Delta_{n+j} - \Delta_{m+j}\Delta_{n-1+j}$$

and

$$\beta_j = \Delta_{m+j}\Delta_{n+j}$$

First (1.43) becomes

$$Net(m, n, p) = \frac{\alpha_{p-1}}{\beta_{p-1}} Net(m, n, p-1) + \frac{\beta_{p-2}}{\beta_{p-1}} Net(m, n, 1, p-2) \quad (1.45)$$

then we would use (b) with  $p_e = 1$  and  $p_i = p-2$ ,

Figure 1.42: graphmath26.

$$\text{Net}(m, n, 1, p-2) = \frac{\alpha_{p-2}}{\beta_{p-2}} \text{Net}(m, n, p-1) + \frac{\beta_{p-3}}{\beta_{p-2}} \text{Net}(m, n, 2, p-3) \quad (1.46)$$

and next we would use (b) with  $p_e = 2$  and  $p_i = p-3$ ,

$$\text{Net}(m, n, 2, p-3) = \frac{\alpha_{p-3}}{\beta_{p-3}} \text{Net}(m, n, p-1) + \frac{\beta_{p-4}}{\beta_{p-3}} \text{Net}(m, n, 3, p-4) \quad (1.47)$$

and so on until

$$\text{Net}(m, n, p-3, 2) = \frac{\alpha_2}{\beta_2} \text{Net}(m, n, p-1) + \frac{\beta_1}{\beta_2} \text{Net}(m, n, p-2, 1) \quad (1.48)$$

$$\begin{aligned} \text{Net}(m, n, p-2, 1) &= \frac{\alpha_1}{\beta_1} \text{Net}(m, n, p-1) + \frac{\beta_0}{\beta_1} \text{Net}(m, n, p-1, 0) \\ &= \frac{\alpha_1}{\beta_1} \text{Net}(m, n, p-1) + \frac{\beta_0}{\beta_1} \frac{\alpha_0}{\beta_0} \text{Net}(m, n, p-1) \end{aligned} \quad (1.49)$$

where in the last line we used (a). Putting it together,

$$\begin{aligned}
\text{Net}(m,n,p) = & \text{Diagram 1} = \text{Diagram 2} \\
& -\mu_{m+p-1} \text{Diagram 3} - \mu_{n+p-1} \text{Diagram 4} \\
& + \mu_{m+p-1} \mu_{n+p-1} \text{Diagram 5}
\end{aligned}$$

Figure 1.43: Netmnp.

$$\begin{aligned}
\text{Net}(m, n, p) &= \frac{\alpha_{p-1}}{\beta_{p-1}} \text{Net}(m, n, p-1) + \frac{\beta_{p-2}}{\beta_{p-1}} \text{Net}(m, n, 1, p-2) \\
&= \left( \frac{\alpha_{p-1} + \alpha_{p-2}}{\beta_{p-1}} \right) \text{Net}(m, n, p-1) + \frac{\beta_{p-3}}{\beta_{p-1}} \text{Net}(m, n, 2, p-3) \\
&= \left( \frac{\alpha_{p-1} + \alpha_{p-2} + \alpha_{p-3}}{\beta_{p-1}} \right) \text{Net}(m, n, p-1) + \frac{\beta_{p-4}}{\beta_{p-1}} \text{Net}(m, n, 2, p-4) \\
&= \dots \\
&= \frac{1}{\beta_{p-1}} \left( \sum_{j=0}^{p-1} \alpha_j \right) \text{Net}(m, n, p-1)
\end{aligned} \tag{1.50}$$

Figure 1.44: Netmn1p-2. Equivalence of last network in fig (1.1.5) with  $Net(m, n, 1, p-2)$ .

Therefore

$$\rho(m, n, p) = \frac{1}{\beta_{p-1}} \sum_{j=0}^{p-1} \alpha_j. \quad (1.51)$$

Or, upon using  $\Delta_{k+2} = -2\Delta_{k+1} - \Delta_k$ ,

$$\begin{aligned} \rho(m, n, p) &= \frac{1}{\Delta_{m+p-1} \Delta_{n+p-1}} \sum_{j=0}^{p-1} (-2\Delta_{m+j} \Delta_{n+j} - \Delta_{m+j-1} \Delta_{n+j} - \Delta_{m+j} \Delta_{n+j-1}) \\ &= \frac{1}{\Delta_{m+p-1} \Delta_{n+p-1}} \sum_{j=0}^{p-1} ((-2\Delta_{m+j} - \Delta_{m+j-1}) \Delta_{n+j} - \Delta_{m+j} \Delta_{n+j-1}) \\ &= \frac{1}{\Delta_{m+p-1} \Delta_{n+p-1}} \sum_{j=0}^{p-1} (\Delta_{m+j+1} \Delta_{n+j} - \Delta_{m+j} \Delta_{n+j-1}) \\ &= \frac{1}{\Delta_{m+p-1} \Delta_{n+p-1}} \left( \begin{aligned} &\Delta_{m+1} \Delta_n - \Delta_m \Delta_{n-1} \\ &\Delta_{m+2} \Delta_{n+1} - \Delta_{m+1} \Delta_n \\ &\Delta_{m+3} \Delta_{n+2} - \Delta_{m+2} \Delta_{n+1} \\ &\dots \\ &\Delta_{m+j+1} \Delta_{n+j} - \Delta_{m+j} \Delta_{n+j-1} \\ &\dots \\ &\Delta_{m+p-1} \Delta_{n+p-2} - \Delta_{m+p-2} \Delta_{n+p-3} \\ &\Delta_{m+p} \Delta_{n+p-1} - \Delta_{m+p-1} \Delta_{n+p-2} \end{aligned} \right) \\ &= \frac{\Delta_{m+p} \Delta_{n+p-1} - \Delta_m \Delta_{n-1}}{\Delta_{m+p-1} \Delta_{n+p-1}} \quad (1.52) \end{aligned}$$

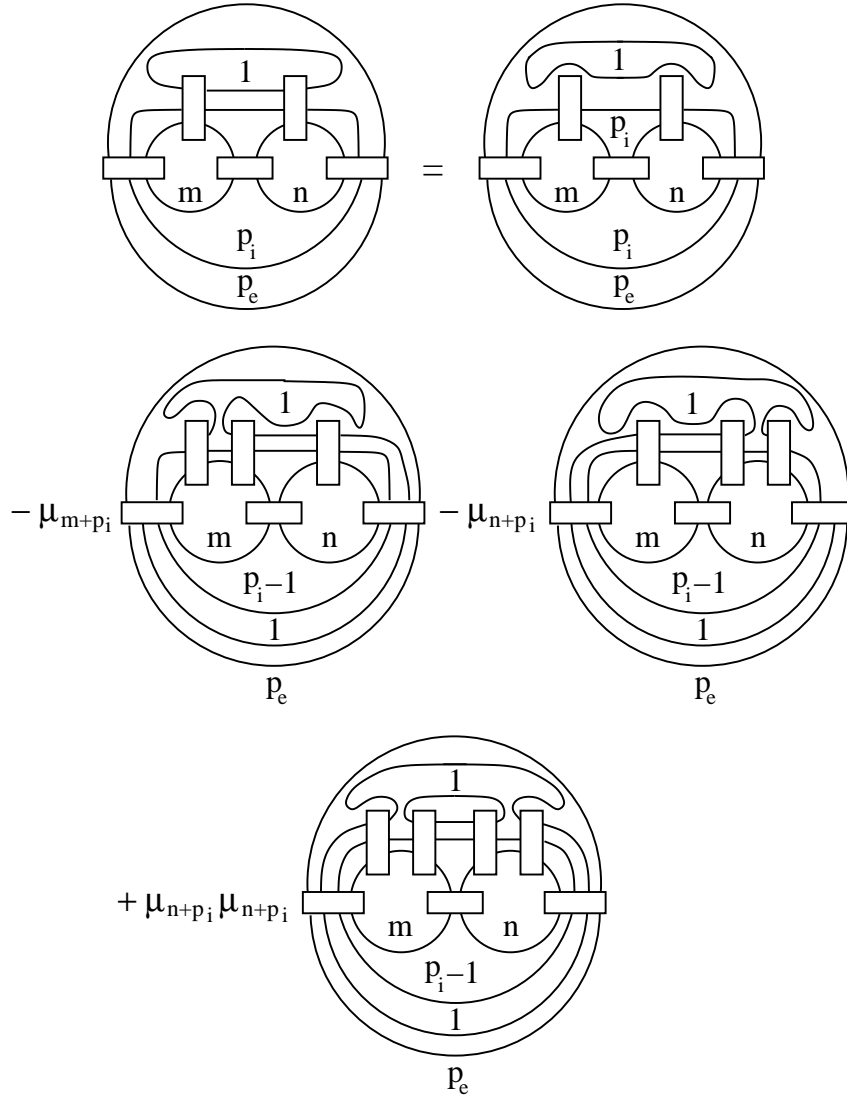

Figure 1.45: Netmnpepi.

We can simplify futher,

$$\begin{aligned}
\Delta_{m+p}\Delta_{n+p-1} - \Delta_m\Delta_{n-1} &= (-1)^{m+p}(m+p+1)(-1)^{n+p-1}(n+p) - (-1)^m(m+1)(-1)^{n-1}n \\
&= (-1)^{m+n+2p-1}[(m+p+1)(n+p) - (m+1)n] \\
&= (-1)^{m+n+2p-1}[np + (m+p+1)p] \\
&= (-1)^{m+n+p}(m+n+p+1)(-1)^{p-1}p \\
&= \Delta_{m+n+p}\Delta_{p-1}
\end{aligned} \tag{1.53}$$

Therefore

Figure 1.46:  $\text{Net}_{mnp_e+1p_i-1}$ .

$$\rho(m, n, p) = \frac{\Delta_{m+n+p} \Delta_{p-1}}{\Delta_{m+p-1} \Delta_{n+p-1}} \quad (1.54)$$

Denote

$$\Delta_n! := \Delta_n \Delta_{n-1} \Delta_{n-2} \cdots \Delta_1.$$

For  $\theta(a, b, c)$ ,

$$\begin{aligned} \theta(a, b, c) &= \rho(m, n, p) \text{Net}(m, n, p-1) \\ &= \left( \prod_{j=1}^p \rho(m, n, j) \right) \text{Net}(m, n, 0) \\ &= \left( \prod_{j=1}^p \rho(m, n, j) \right) \Delta_{m+n} \end{aligned} \quad (1.55)$$

Hence, by (1.54)

$$\begin{aligned} \theta(a, b, c) &= \prod_{j=1}^p \left[ \frac{\Delta_{m+n+j} \Delta_{j-1}}{\Delta_{m+j-1} \Delta_{n+j-1}} \right] \Delta_{m+n} \\ &= \frac{(\Delta_{m+n+p} \Delta_{m+n+p-1} \cdots \Delta_{m+n}) \Delta_{p-1}!}{(\Delta_{m+p-1} \Delta_{m+p-2} \cdots \Delta_m) (\Delta_{n+p-1} \Delta_{n+p-2} \cdots \Delta_n)} \\ &= \frac{\Delta_{m+n+p}! \Delta_{n-1}! \Delta_{m-1}! \Delta_{p-1}!}{\Delta_{m+p-1}! \Delta_{n+p-1}! \Delta_{m+n-1}!} \end{aligned} \quad (1.56)$$

The minus signs in the factorial simplifies as follows

$$\begin{aligned}
\Delta_{m+n+p}! &= (-1)^{m+n+p}(m+n+p+1)(-1)^{m+n+p-1}(m+n+p)\cdots(-1)^1 2! \\
&= (-1)^{(m+n+p)+(m+n+p-1)+\cdots+1}(m+n+p+1)! \\
&= (-1)^{(m+n+p)(m+n+p+1)/2}(m+n+p+1)!
\end{aligned} \tag{1.57}$$

So that we get

$$\begin{aligned}
\Delta_{m+n+p}! &= (-1)^{(m+n+p)(m+n+p+1)/2}(m+n+p+1)! \\
\Delta_{m+n-1}! &= (-1)^{(m+n-1)(m+n)/2}(m+n)! \\
\Delta_{m-1}! &= (-1)^{(m-1)m/2}m!
\end{aligned} \tag{1.58}$$

Collecting the exponents of  $(-1)$  in (1.56) is

$$\begin{aligned}
&\frac{1}{2}[(m+n+p)(m+n+p+1) + (n-1)n + (m-1)m + (p-1)p + \\
&\quad + (m+p-1)(m+p) + (n+p-1)(n+p) + (m+n-1)(m+n)] \\
&= \frac{1}{2}[(m+n+p)^2 + n^2 + m^2 + p^2 \\
&\quad + (m+p)^2 - (m+p) + (n+p)^2 - (n+p) + (m+n)^2 - (m+n)] \\
&= \frac{1}{2}[(m^2 + n^2 + p^2 + 2mn + 2mp + 2np) + n^2 + m^2 + p^2 + \\
&\quad + 2m^2 + 2n^2 + 2p^2 + 2mp + 2np + 2mn - 2(m+n+p)] \\
&= 2m^2 + 2n^2 + 2p^2 + 2mn + 2np + 2pm - m - n - p \equiv m + n + p + 2k.
\end{aligned} \tag{1.59}$$

where  $k$  is an integer.

Therefore,

$$\theta(a, b, c) = \frac{(-1)^{m+n+p}(m+n+p+1)!m!n!p!}{(m+n)!(n+p)!(m+p)!} \tag{1.60}$$

where

$$\begin{aligned}
m &= \frac{a+b-c}{2}, \\
n &= \frac{b+c-a}{2}, \\
p &= \frac{a+c-b}{2}.
\end{aligned} \tag{1.61}$$

$$\begin{aligned}
m+p &= 2a \\
m+n &= 2b \\
n+p &= 2c \\
m+n+p &= 2a+2b+2c.
\end{aligned} \tag{1.62}$$

## TET

Recoupling formula

$$\begin{array}{c} b \\ \diagdown \\ \bullet \\ \diagup \\ a \end{array} \begin{array}{c} \text{---} j \text{---} \\ \bullet \end{array} \begin{array}{c} c \\ \diagup \\ \bullet \\ \diagdown \\ d \end{array} = \sum_i \left\{ \begin{array}{ccc} a & b & i \\ c & d & j \end{array} \right\} \begin{array}{c} b \\ \diagdown \\ \bullet \\ \diagup \\ a \end{array} \begin{array}{c} i \\ \text{---} \\ \bullet \end{array} \begin{array}{c} c \\ \diagup \\ \bullet \\ \diagdown \\ d \end{array}$$
